

# Cyber security services

At Frazer-Nash, we understand that operating in cyberspace is essential to an organisation that wants to remain competitive, increase innovation, and grow its business. As cyber-attacks escalate, it's vital that organisations secure their operations from ever more complex and diverse cyber threats – helping to protecting your assets and reputation.

## OUR SERVICES

Our consultants apply their expertise and know-how to develop, enhance and protect your critical assets, systems and processes. By understanding your business and the complex interaction between the external environment and your people, technology and processes, we're able to add real value – helping you develop and secure your capabilities, brand and reputation by combining skills and experience gained from operating across a range of industry and government sectors.

### ▶ Government security accreditation support

We support government project teams and suppliers to ensure that systems and evidence are 'accreditor-ready'. We provide Security Assurance Co-ordinators, accreditation evidence preparation and bespoke security advice for technology and management challenges. Our team are security-cleared and CESG Certified Professionals (CCP), and have experience of using CESG, ISO27000 and NIST standards across the military (land, sea and air), power generation, distribution and rail sectors.

### ▶ Risk assessment and management

We are experienced in risk identification, assessment and management to HMG, ISO27000 and NIST requirements. We use the most appropriate approach to suit your needs and work to ensure that the outputs of a risk assessment are relevant to your business objectives.

### ▶ Requirements capture

We're experienced in security requirements capture and support clients as they define, acquire or supply new computer-based products and services. We work with requirements capture specialists so ensure that security issues are integrated into system specifications.

### ▶ Industrial control and instrumentation systems (C&I)

With particular experience in regulated industries, we understand the issues and technologies of industrial control systems and the relationship between cyber security and safety. Our C&I and safety engineers work alongside our cyber security team to deliver integrated, industry-tailored services.

### ▶ Integrated security

Our human factors and physical security specialists support our cyber security consultants to deliver rounded, comprehensive services – putting all aspects of security into our clients' business context.

## BENEFITS

### ▶ Business resilience

Commercial and public sector organisations must be able to fulfil their business purpose even in the presence of unforeseen events, such as a computer virus infection, data theft, or service interruption following a process control failure. We work with you to help you understand the risks to your business and work with you to develop plans that will help your business recover from the event.

### ▶ Regulatory and legal compliance

Whether it's working with an industry regulator, getting your defence system accredited, or ensuring compliance with ISO27001 or the Data Protection Act, understanding your security risks and demonstrably managing them is essential if your systems are to deliver the business benefits they were built for.

### ▶ Integrated cyber security

Computer-based systems don't exist in a vacuum: they have physical presence, sometimes manipulating their physical environment; they have managers and users; they have a business purpose. Good cyber security sees these aspects as a whole, allowing security disciplines to complement each other, increasing the effectiveness of your security investment.

### ▶ Stakeholder confidence

Your customers, partners, shareholders, senior management, insurers, suppliers, regulators, your local communities – all of them want confidence that the confidentiality, integrity and availability of your information, processes and systems is appropriate for your business. Good, demonstrable cyber security will give them this confidence.
